

Python Keywords Cheat Sheet

Keyword	Explanation	Example
False	Represents a Boolean false value	<code>x = False</code>
True	Represents a Boolean true value	<code>x = True</code>
None	Represents the absence of a value or null	<code>x = None</code>
and	Logical AND operator. Returns <code>True</code> if both conditions are true	<code>if x > 0 and y > 0:</code>
or	Logical OR operator. Returns <code>True</code> if at least one condition is true	<code>if x > 0 or y > 0:</code>
not	Logical NOT operator. Reverses the truth value	<code>if not x:</code>
as	Used for aliasing (e.g., modules or exceptions)	<code>import numpy as np</code>
assert	Used for debugging; checks if a condition is true	<code>assert x > 0, "x must be positive"</code>
break	Exits a loop prematurely	<code>for i in range(5): break</code>
class	Defines a class	<code>class MyClass:</code>
continue	Skips the rest of the loop iteration	<code>for i in range(5): continue</code>
def	Defines a function	<code>def my_function():</code>
del	Deletes an object or variable	<code>del x</code>
elif	Else-if condition in an if statement	<code>if x > 0: elif x == 0:</code>
else	Defines the block of code executed if all conditions fail	<code>if x > 0: else:</code>
except	Handles exceptions in a try block	<code>try: pass except Exception:</code>

finally	Defines cleanup actions after try-except blocks	<code>try: pass finally: cleanup()</code>
for	Starts a for loop	<code>for i in range(5):</code>
from	Imports specific parts of a module	<code>from math import pi</code>
global	Declares a global variable	<code>global x; x = 5</code>
if	Starts a conditional block	<code>if x > 0:</code>
import	Imports a module	<code>import os</code>
in	Checks membership or iteration	<code>if x in list:</code>
is	Tests object identity	<code>if x is y:</code>
lambda	Defines an anonymous function	<code>lambda x: x * 2</code>
nonlocal	Refers to a variable in the nearest enclosing scope	<code>nonlocal x</code>
pass	Does nothing; a placeholder	<code>pass</code>
raise	Triggers an exception	<code>raise ValueError("Error!")</code>
return	Returns a value from a function	<code>return x</code>
try	Starts a block of code to handle exceptions	<code>try: pass</code>
while	Starts a while loop	<code>while x > 0:</code>
with	Simplifies resource management (e.g., file handling)	<code>with open('file.txt') as f:</code>
yield	Pauses and returns a value from a generator	<code>yield x</code>
